Homework 7: Due Friday, February 28

Problem 1: Let $n, k \in \mathbb{N}^+$. Count the number of solutions to

$$x_1 + x_2 + \dots + x_k \le n$$

where each $x_i \in \mathbb{N}$. For example, if n = 2 and k = 2, then there are 6 solutions given by the following ordered pairs (x_1, x_2) :

$$(0,0)$$
 $(0,1)$ $(1,0)$ $(0,2)$ $(1,1)$ $(2,0)$

Your final answer should not involve any summations.

Problem 2: Suppose that you have 12 identical apples and 1 orange.

a. In how many ways can you distribute the fruit to 4 distinct people?

b. In how many ways can you distribute the fruit to 4 distinct people in such a way that each person receives at least one piece of fruit?

Problem 3: Given a finite sequence of zeros and ones, define a run of ones to be a maximal consecutive subsequence of ones. For example, the sequence 11101100000100101100 has 5 runs of ones (and also 5 runs of zeros). Let $m, n, k \in \mathbb{N}^+$ with $k \leq m$ and $k \leq n$. Calculate the number of sequences of zeros and ones of length m + n which have all three of the following properties:

- \bullet Have exactly m zeros and n ones.
- Starts with a one and ends with a zero.
- Have exactly k runs of ones.

Hint: How many runs of zeros must such a sequence have? Think about the lengths of the various runs and how they relate to compositions.

Problem 4: Let B(n,k) be the number of compositions of n into k parts. Using a direct combinatorial argument (so without using our formula), show that

$$B(n,k) = B(n-1,k-1) + B(n-1,k)$$

for all $n, k \in \mathbb{N}$ with $2 \le k \le n$.

Problem 5: Show that $S(n,2) = 2^{n-1} - 1$ for all $n \ge 2$ in the following two ways:

- a. By induction.
- b. By a combinatorial argument.

Problem 6: Recall that $S(n, n-1) = \binom{n}{2}$ for all $n \geq 2$. Show that

$$S(n, n-2) = \binom{n}{3} + 3 \cdot \binom{n}{4}$$

for all $n \geq 3$.
